#### **Unity – Data Save & Pause**

NHN NEXT 서형석

ScoreManager

점수관리만을 위한 Manager

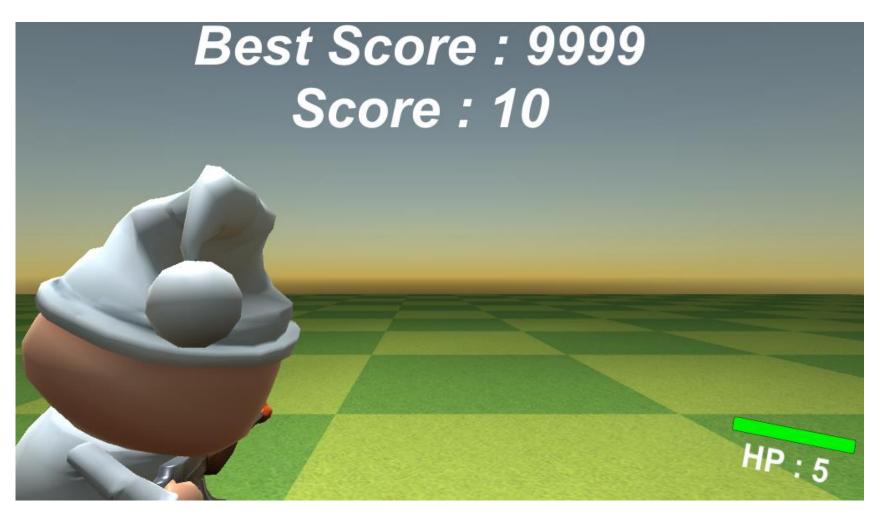

게임내에서 점수를 획득하는 방법은 너무 많을 수 있다. 그래서 어떠한 클래스에서도 간단히 접근할 수 있는 방법이 필요.

```
public class ScoreManager: MonoBehaviour
   static ScoreManager _instance = null;
   public static ScoreManager Instance()
      return _instance;
   void Start()
      if( _instance == null )
         _instance = this;
      else
          Destroy( gameObject );
```

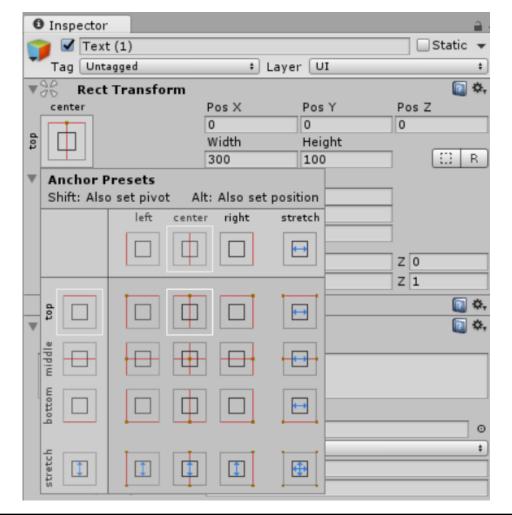

```
public class ScoreManager: MonoBehaviour
  int _bestScore = 0;
     _myScore = 0;
  public int bestScore
     get
        return _bestScore;
```

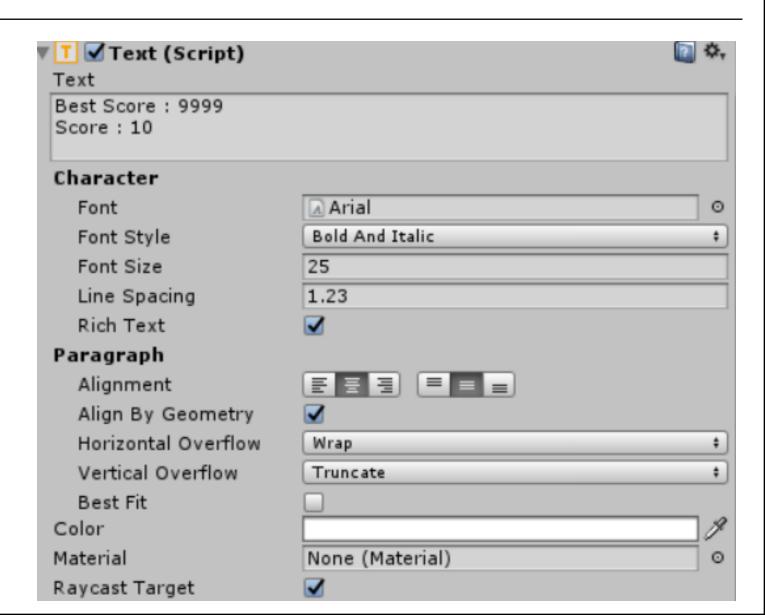

```
public int myScore
    get
                             get/set 구현
       return _myScore;
    set
       _myScore = value;
       if (_myScore > _bestScore)
         _bestScore = _myScore;
```

- 점수 화면에 출력

#### - Text UI 추가

```
using System.Text;
                                                                   void
                                                                        Update()
public class ScoreManager: MonoBehaviour
                                                                           UpdateScore();
  public UnityEngine.UI.Text scoreText;
  StringBuilder scoreTextBuilder = new StringBuilder();
  void UpdateScore()
     scoreTextBuilder.Length = 0;
     scoreTextBuilder.AppendFormat( "Best Score : {0}\text{\psi}nScore : {1}\text{\psi}, bestScore,
                                                                                        myScore);
     scoreText.text = scoreTextBuilder.ToString();
```

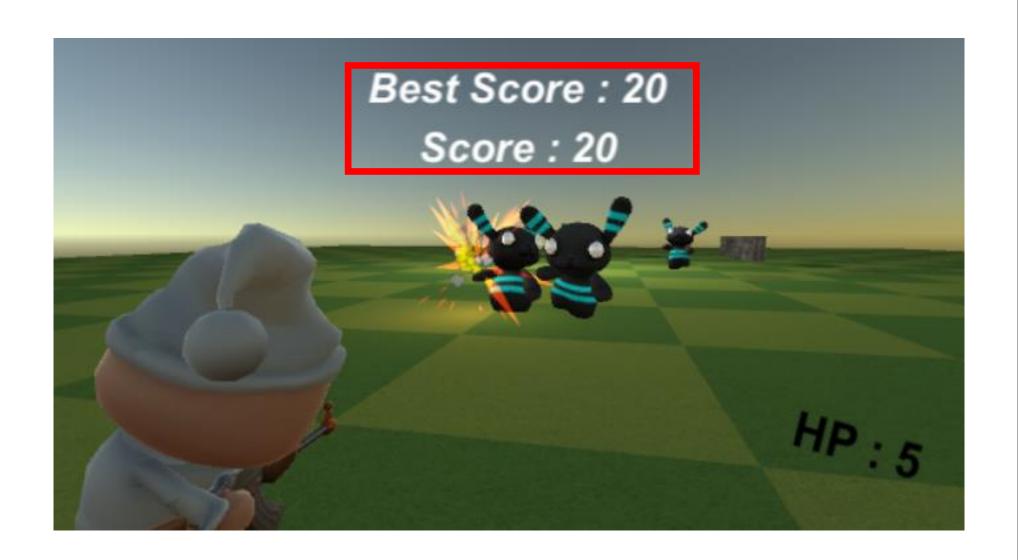

#### - 점수 화면에 출력

```
using System.Text;
public class ScoreManager: MonoBehaviour
        Update()
  void
       UpdateScore();
```

#### - 점수 처리 : 적이 죽을 때마다 일정 점수 추가

```
public class Zombie: MonoBehaviour
  public int score = 10;
  void Update()
      case ENEMYSTATE.DEAD:
         // Destroy( gameObject );
         StartCoroutine( "DeadProcess");
         enemyState = ENEMYSTATE.NONE;
         ScoreManager.Instance().myScore += score;
      break;
```

- 점수 확인

- 문제점 파악: 최고 점수가 남아있지 않는다.

일반적인 게임에서 최고점수는 게임이 다시 실행되어도 남아 있어야 한다.

- PlayerPrefs : Data 저장용 클래스

## **PlayerPrefs**

Namespace: UnityEngine

#### **Description**

Stores and accesses player preferences between game sessions.

```
public class ScoreManager: MonoBehaviour
    void SaveBestScore()
       PlayerPrefs.SetInt( "Best Score", _bestScore );
    void LoadBestScore()
       _bestScore = PlayerPrefs.GetInt( "Best Score", 0 );
```

```
void Start()
      LoadBestScore();
   public int myScore
      set
         _myScore = value;
         if (_myScore > _bestScore)
            _bestScore = _myScore;
           SaveBestScore();
```

```
public class ScoreManager: MonoBehaviour
   void Start()
      if( _instance == null )
        _instance = this;
      else
        Destroy( gameObject );
      LoadBestScore();
  public int myScore
     get
        return _myScore;
     set
        _myScore = value;
        if (_myScore > _bestScore)
           _bestScore = _myScore;
           SaveBestScore();
```

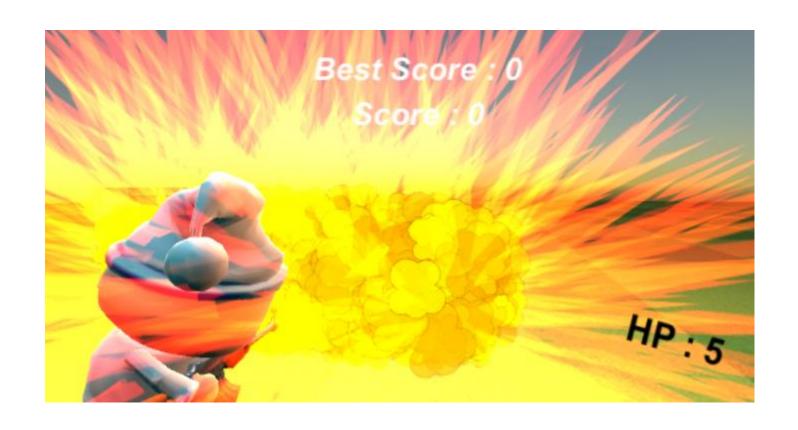

# PlayerPrefs Save/Load

- 생각해 볼 점: PlayerPrefs 어디에 저장되는가?

- 생각해 볼 점 : 보안상의 문제점 대응 방안.

- 일시 정지 구현

```
public class Pause: MonoBehaviour
  bool gamePause = false;
  void Update ()
    if( Input.GetKeyDown(KeyCode.Escape))
      gamePause = !gamePause;
      if (gamePause == true)
         Time.timeScale = 0.0f;
      else
         Time.timeScale = 1.0f;
```

#### Pause 구현

#### - 포탄 생성 방지

```
public class Pause: MonoBehaviour
   public static bool gamePause = false;
```

#### - 포탄 생성 방지

```
public class FireBall: MonoBehaviour
  void Update()
      if( Pause.gamePause )
         return;
```
